

TOGAF® Certification for People

TOGAF Enterprise Architecture Practitioner
Learning Studies
Student Book

Name:

Date:

The Learning Studies help people get certified in TOGAF Enterprise Architecture. They are a necessary part of a training course.

This booklet is to be given to candidates to refer to for the case studies and situations

Permission is granted to Accredited TOGAF Training Course Providers for use in an Accredited TOGAF Training Course subject to the terms and conditions on page 3.

1 INSTRUCTIONS

Your trainer will provide you with the instructions and guidance applicable to your Accredited Training Course delivery.

The TOGAF Enterprise Architecture Practitioner Learning Studies are **hands-on activities** that help you learn how to practice Enterprise Architecture. These exercises are based on real situations that Enterprise Architects face, and they help you **practice** what you've learned in the course. You can do these exercises in class or at home **with feedback from a trainer**.

You have to read a story (case study) about a company undergoing a transformation. **You can use the Body of Knowledge to help you.** You can do this exercise more than once. It's a good idea to work with other students but you can also do these activities by yourself.

You should spend at least three hours on this exercise, but you do not have to do it all in one go. There are 18 situations to choose from based around the case study, and **you need to do at least 10** of them for your training course.

Make sure to **complete at least one situation from each unit**. If you skip any situations, make sure to still read them so you do not lose track of what's going on. Your trainer will review the situations and approaches with you. Keep in mind, **this is not a test, and it is not meant to prepare you for, or simulate, the certification exam**.

Lastly, please remember, this should not be used as a practice test for your certification exam.

Each situation is about a specific topic in the section (like Stakeholder Management). At the beginning of each situation, there is a statement about what you should learn and where in the standard the situation comes from (like G186 §5.2.1). Look at the sections in the referenced document when thinking about the situation.

1 INSTRUCTIONS

THE APPLIED TOGAF ENTERPRISE ARCHITECTURE PRACTITIONER BADGE

After you finish the Learning Studies in a training course, and your provider sends your details to The Open Group, you can receive an Applied Practitioner badge.

You will need to pass exams and get certified in TOGAF Enterprise Architecture Practitioner to receive this badge.

FINDING YOUR CANDIDATE ID

To show you completed the training exercises, your course provider needs your **Candidate ID**. You can get this special ID from your online account on The Open Group website.

Just sign in at: <https://www.opengroup.org>, or if you do not already have an account, sign up to create one.

The Candidate ID number is shown as the individual ID in your profile at: <https://www.opengroup.org/account-information>

1 INSTRUCTIONS

SITUATION, PROBLEM STATEMENT AND APPROACHES

Each situation ends with a problem statement. You can choose out of 4 approaches. **One approach is the most recommended based on the TOGAF standard.** The other approaches are less suitable.

The most optimal learning experience is to identify them and explain why you feel they are suitable or not.

STUDENT BOOK AT A GLANCE

This student book is designed to be interactive! We've intentionally left spaces throughout for you to jot down your thoughts, notes, and observations as you go.

After each case study, you'll find dedicated **'Notes' pages** — for capturing your first impressions and reactions.

You'll also see additional **'Notes' pages** after each of the four possible approaches, giving you room to reflect on each one.

Plus, we've included a **'Recommended Approaches' grid** where you can order the four approaches from the best to incorrect — helping you think critically about each option.

1 INSTRUCTIONS

DOCUMENT REFERENCES

Each situation is based on what you were supposed to learn in a lesson. It mentions the specific things you were supposed to understand or be able to do and refers to a specific section of the curriculum. The references are short codes that are explained in the table below.

2 CASE STUDY PART 1

The situations are all based on a company that sells goods to consumers all around the world. For the purposes of this Case Study you are working in the Enterprise Architecture team. Your role in the team might change depending on the situation we're talking about. Your role and responsibilities are described for each situation.

The company manufactures and sells consumer goods all around the world. They design, create, and produce these products, then send them out to stores. In the company, the Enterprise Architecture team has done really well by following practices drawn from the TOGAF Standard.

Also, an Architecture Board, consisting of representatives from all areas of the company, is responsible for overseeing and managing Architecture Governance and related processes within the organization. In line with its Enterprise Architecture approach, the company highly values empowering stakeholders to make important decisions.

The Core IT systems in the company include:

- A Software as a Service (SaaS) Human Resources, Product Management, and Customer Relationship Management (CRM) system (referred to as the enterprise CRM in these exercises)
- A Platform as a Service (PaaS) hosted Enterprise Resource Planning (ERP) system
- On-premises specialist manufacturing systems that are optimized for each of the manufacturing centers.

The company is starting an initiative (a course of action) to change its way of doing business by adding digital products and services to its offerings, which we refer to in these exercises as the digital transformation initiative.

This means they will sell things online as well as in stores.

The digital transformation initiative is product and services driven, as opposed to platform driven. It is progressing through three approaches:

1. Three product lines, as an experiment, are testing how well they can sell digital products directly to consumers. These products are being sold separately from the main brand.
2. A team is creating a platform to support digital products based on a common approach to customer information integration and security.
3. Two product lines are experimenting with the development of direct-to-consumer digital products using third-party platforms.

Creating digital products and their platform involves using agile software development methods. The company is trying to gain experience with digital products by using a minimalistic approach and is fine with using temporary solutions and getting rid of them later.

Adding digital products will not change the focus of the company. It will still be a company that sells goods to consumers all around the world. The digital products will be sold either through the third-party platforms (approach 3) or directly to customers through a new model (approach 1). While the company is working on becoming more digital, the CEO wants to make sure the company continues to make money from its existing products.

2 CASE STUDY PART 1

NOTES

3 THE CONTEXT FOR ENTERPRISE ARCHITECTURE

SITUATION 1-1

For situations 1-1 to 1-3, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM

So far, the EA team has been working on helping the company with its IT portfolio (Architecture to Support Portfolio). The team is doing well and is working closely with the company's top executives. They are using Architecture Roadmaps to plan out the IT portfolio, which includes mapping out important capabilities for areas like HR, finance, consumer product management, manufacturing, and other key aspects of the business. These capabilities are in line with the company's business-to-business model and value chain, and information integration has been achieved across the value chain.

The EA team was not involved in defining the approaches for the digital transformation initiative because they did not have enough resources or the right skills at the time. They had received urgent requests for architecture work from the consumer product teams and digital product platform team, but since they do not have digital products and services skills or knowledge, and the project was urgent, they advised the teams to hire consultants who specialize in digital consumer products.

PROBLEM

You have been asked by the EA team leader to recommend how the current EA team can contribute to the digital transformation initiative until new team members, who have the required skills, join the group.

Which approach will you recommend, and why?

Hint It is recommended to start organizing the information provided in the case study to identify the domains and purposes applicable to the situation. You can use the template provided to create the artifact(s).

3 THE CONTEXT FOR ENTERPRISE ARCHITECTURE

Curriculum Reference:
LO -1.1 G186 §3.1
LO -1.3 ICC §3.13 G184 §3.3
LO -5.5 G186 §3.2.2

SITUATION 1-1 Approaches

1 The digital products and platform are separate initiatives that are being developed as projects. To get the most out of these experiments, you recommend focusing on their purpose and value.

Also, when creating the digital product platform, it is important to consider how all the different parts work together and how they might depend on each other in the future. This will help make sure that all projects are connected and working together towards the same goals.

2 You recommend that the team consider each product as a solution and a project. The EA team needs to be reorganized to support the goals and the value of the experiment. The development of the digital product platform should support integration and alignment between projects. Without constraints, controls, and architecture requirements, corporate alignment and information integration will be lost.

3 Since we are still testing and creating new digital products and platforms, you recommend to think of the projects in the digital transformation initiative as a collection of work, like a portfolio.

You would treat the existing enterprise CRM as one portfolio and the digital transformation initiative as another. Integration between the two portfolios would be a long term goal, considered as a 'nice to have'. This will fit as an extension of the EA team's experience in identifying projects, their terms of reference, approach, and how they work together. It will help the company balance innovation and efficiency.

4 You recommend including the common digital products platform with the current IT portfolio managed by the team because it aligns with other shared Core IT systems. This will protect the alignment and information integration that is a risk. This will allow the EA team to set constraints and controls for the digital product platform.

3 THE CONTEXT FOR ENTERPRISE ARCHITECTURE

SITUATION 1-2

For situations 1-1 to 1-3, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM

The consultants hired for the digital transformation initiative have made a detailed proposal. The proposal has focused only on the experiments in digital consumer products.

One of the consumer product managers has talked to the EA team about some problems with the proposal. The product managers are very concerned because the consultants did not think about how to continue selling the company's current physical products while also introducing new digital products. The consumer product manager also wants to figure out how to make fundamental changes in customer engagement for one of the experiments. For example, right now, when a customer returns a product, it needs to be checked before they can get a refund. But this workflow will not work for digital products or services.

Customer engagement is an interaction between an external consumer/customer (either B2C or B2B) and an organization (company or brand) through various online or offline channels. – Wikipedia

PROBLEM

You have been asked how the EA team should support the digital transformation initiative and address the concerns raised by the consumer product manager.

Which approach do you recommend, and why?

3 THE CONTEXT FOR ENTERPRISE ARCHITECTURE

Curriculum Reference:
LO -1.1 G186 §3.1
LO -1.5 EACG §6.1, 6.2 G186 §15.2.1,
15.2.2

SITUATION 1-2 Approaches

1 You recommend extending the existing enterprise CRM to support digital consumer products. You will review the existing Application Architecture and define the capabilities needed to support a direct relationship with consumers. This will require new interfaces to enable direct selling.

You will check with the consumer product manager for additional requirements. You recommend that the roadmap for the enterprise CRM be adjusted to add these new capabilities.

2 You recommend involving the EA team to take a broader approach that deals with the entire product portfolio. You review if the correct stakeholders have been identified, and if not engage them. You recommend adding specialist subject matter experts to the EA team to develop architecture models and analyze gaps. This will form the basis of a renewed architecture development project.

3 You recommend reviewing where the consumer product manager is not happy with the consultant's proposal. You will also review the assessments made of the EA team to identify the gaps in EA capability that need to be addressed. The EA team can then be involved to determine which gaps are in the project's scope. The gaps will form the basis of the architecture development project.

4 You recommend that a new architecture project is defined, so the EA team can begin working on it. You will create a change request to use the current enterprise CRM and identify changes needed to support digital consumer products. The architecture development project will then address the fundamental changes to improve the customer engagement with digital products, for example how to manage returns and refunds.

3 THE CONTEXT FOR ENTERPRISE ARCHITECTURE

SITUATION 1-3

For situations 1-1 to 1-3, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM

The roadmap for improving the existing enterprise CRM includes:

- Making small improvements that help work better with international distributors
- Offering warranty service for local products in different countries, with changes like offering service in different languages and working with new partners for warranty service
- Providing prepaid shipping for customers who need to send their products in for repairs

As part of the digital transformation initiative, two product lines have now launched digital products or services to go with their traditional products. But they are having trouble keeping track of subscriptions and returns in the enterprise CRM. A consumer product manager, responsible for a product that will be sold directly to consumers, has been told that the proposed solution will use a stand-alone CRM system that supports direct engagement with consumers. This consumer product manager is worried about whether this system will work well in the future when both physical and digital products are sold through the same channels.

PROBLEM

You have been asked how to address the concerns raised by the consumer product manager?

Which approach do you recommend, and why?

3 THE CONTEXT FOR ENTERPRISE ARCHITECTURE

Curriculum Reference:
LO -1.7 G186 §5.4, 13
LO -1.10 G152 §3.1.1

SITUATION 1-3 Approaches

1 You recommend establishing an architecture development project to provide standard APIs to access the enterprise CRM. This will provide a reliable service that can be accessed by the digital product experiments.

These API interfaces should be based on industry standard approaches for a long-term solution. It can be included to the roadmap for the enterprise CRM without affecting the efficiency improvements expected to be made.

2 You recommend starting an architecture development project to explore the options that will lead to a new standard CRM platform for both physical and digital projects. You recommend adopting the candidate architectures that match past decisions on how to improve customer engagement efficiency and that fit with the current roadmap. You will publish this roadmap to the EA Repository.

3 You recommend establishing an architecture development project to explore short-term workarounds that support digital-product returns and subscriptions. Once you understand the short-term workarounds you will include work packages to the roadmap for the enterprise CRM. This way, the short-term workarounds will be added to the existing enterprise CRM so that it can continue to support all product lines, digital, physical, or hybrid.

4 You recommend that an architecture development project identify multiple candidate architectures for the enterprise CRM, including approaches for co-existence with the systems produced as part of the digital transformation initiative.

Each of these candidate architectures will be optimized for different stakeholder concerns. All candidate architectures will show how decisions lead to outcomes so that you are able to develop a set of transition architectures. This will help you minimize the uncertainty of the transitions.

3 THE CONTEXT FOR ENTERPRISE ARCHITECTURE

YOU HAVE A NEW ROLE

You have experience with digital products and have been brought in to add your skills to the EA team. You are joining the EA team while it is in transition, thereby extending its capability to better support the digital transformation initiative.

SITUATION 1-4

The EA team is having trouble showing the stakeholders how new digital product experiments fit with the company's current products and practices.

Some product managers prefer a “digital first” culture, while others are more concerned with making sure the existing products continue to generate revenue.

Some EA team members are hesitant to change their approach to EA and work on a digital transformation. Instead, they prefer to stick to the old portfolio roadmap deliverables.

The leader of the EA team told you about a webinar where they talked about a similar situation. They mentioned that the TOGAF Library has resources that can help with these issues.

PROBLEM

The EA team leader wants you to explain to the EA team how the experiments in the digital transformation initiative are connected and make sense.

Which approach do you recommend, and why?

3 THE CONTEXT FOR ENTERPRISE ARCHITECTURE

SITUATION 1-4

Approaches

[1] The DPBoK Standard includes a scaling model that can be summarized as “from startup to enterprise” showing how organizations cluster at certain sizes and need different capabilities as they scale.

Curriculum Reference:

LO -1.2 G186 §3.2.3

LO -1.11 G217 §4.2.1-4.2.4

1 You will review the TOGAF Library for material on business reference models, and digital transformation. This will provide guidance material you can use, including architectures and implementation strategies for the digital organization. You will then extend the existing business capability model used by the EA team to include the business capabilities necessary to support a digital-first culture.

Then you develop a set of informative materials that explain the missing and changed capabilities. You make sure that your materials use the language and style of existing capability development material created by the EA team.

2 You will search the TOGAF Library for guidance on the digital enterprise and enterprise agility. You will give the EA team a reading list of documents you think are relevant. You will update the business capability model with a focus on digital-first. Using this model as a reference, you will then perform a gap analysis between the existing business capability and the optimal digital business capability. Then you will develop a roadmap for the senior leaders showing the capabilities that need to be developed or changed to for a future digital business model

3 You will use the four contexts defined in the Digital Practitioner Body to Knowledge (DPBoK) Standard[1] to explain to the EA team that as an organization grows, it faces different basic challenges. You will review the EA team’s library to see if there are viewpoints and corresponding views that address the fundamental issues in scaling from the Founder context to the Enduring Enterprise context.

If there are no such viewpoints, you would plan to develop them. You will give materials to the team explaining how an experiment looks like in the Founder/Team contexts, and compare with how it will look like in the Enduring Enterprise context.

4 You will create informative materials to explain how digital products are developed using agile methods. You want to help the team understand the change from traditional IT-portfolio planning to the digital product approach.

The most important point you need to make is the difference between a waterfall approach and agile development. You explain that each of the digital experiments is applying minimal viable product (MVP) agile software development. You make sure that the information you provide focuses on having an agile mindset and supporting agile software development.

4 SUPPORTING THE ADM

YOU HAVE A NEW ROLE

For situation 2-1, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM.

SITUATION 2-1

You are in an EA team meeting. The meeting is about the digital transformation initiative, and the evolution of the EA team to become engaged on customer experience for digital products. You know that there are fundamental changes in customer engagement coming in your area of responsibility. For example, in the enterprise CRM workflows, a physical good must be returned and inspected before refunding a consumer or providing a replacement product. This does not apply for digital consumer products or digital services.

As part of preparation for the meeting you talked with the new team member who has experience with digital products, and discussed the TOGAF Library, a set of guidance materials and best practices that includes materials about digital transformation. During the conversation you made notes about some relevant titles. In the meeting the EA team leader says one of the activities important to a high functioning EA team is ensure that our Enterprise Architecture Capability meets the current requirements.

PROBLEM

At the meeting the EA team leader asks you to outline your approach for coexistence of the enterprise CRM and the digital platform initiative. It is noted that to maintain continuity with prior analysis and roadmap planning you will continue to work at a portfolio-level.

What is your answer and where will you look for guidance? Which of the following is the best answer?

4 SUPPORTING THE ADM

SITUATION 2-1 Approaches

Curriculum Reference:
LO -8.1 ICC §2
LO -8.6 G186 §5.1
LO -8.9 AADM §3.2, G186 §3.2.1
LO -8.12 ADMT §5.1, 5.2 G186 §6.3.2
LO -8.19 ADMT §9.4 G152 §3.2.1, 5.3.4,
5.6.1, 5.7

1

You will begin by creating a new target architecture for a customer relationship management (CRM) system. The current approach of the enterprise CRM cannot effectively support a direct engagement model, a shared platform, and third-party product platforms.

The EA Repository, and metamodel will need to be re-worked to accommodate more detailed information capture and analysis. You note that the *Information Architecture: Customer Master Data Management* guide in the TOGAF Standard, 10th Edition can be used as a reference. It will help to define the standards needed to integrate multiple engagement systems.

Without this new architecture activity, the company will be unprepared for level of risk from increased use of customer's personal information, multiple online channels to that information, and complex international regulations.

2

Since the current digital strategy is still experimental, you want to analyze possible risks more thoroughly, to help improve the results of the digital experiments. The growth of direct engagement with customers will increase the amount of personal information, external access points, and complex international regulations.

There will be a need to focus on information security of customer data due to these changes. A set of assessments will be developed that can be used to check the status of customer engagement and personal information security.

This will allow you to identify a set of capability gaps within the enterprise, and a set of patterns for the different products and projects to follow. In the TOGAF Library you noted that the *TOGAF Digital Business Reference Model (DBRM)* (part of the *TOGAF Standard, 10th Edition*), and the *Seven Levers of Digital Transformation* whitepaper as useful resources.

4 SUPPORTING THE ADM

SITUATION 2-1

Approaches

Curriculum Reference:
LO -8.1 ICC §2
LO -8.6 G186 §5.1
LO -8.9 AADM §3.2, G186 §3.2.1
LO -8.12 ADMT §5.1, 5.2 G186 §6.3.2
LO -8.19 ADMT §9.4 G152 §3.2.1, 5.3.4,
5.6.1, 5.7

3 The digital experiments include a mix of a direct engagement, building a shared platform, and using third-party product platforms. These approaches will increase the amount of personal information collected, external access points, and complex international regulations.

The *Information Architecture: Customer Master Data Management* guide (part of the *TOGAF Standard, 10th Edition*) in the TOGAF Library provides a starting point to ensure consistent customer data. To support the new detailed data and its analysis, you will need to update the EA Repository and metamodel. You will minimize the detailed analysis to customer information to develop a set of Architecture Requirements Specifications and controls on customer data interchange and protection.

Applying these to the different engagement paths will minimize information security risk and ensure common customer data can be maintained. You know the existing enterprise CRM will not meet these data interchange requirements. You will be able to identify the gaps to the enterprise CRM so your senior leader decision makers can schedule the CRM improvement work, and the necessary improvements to the digital experiments as they migrate to become stable production systems.

4 You explain that the current model of a shared enterprise CRM may not work, and that the switch to digital products and direct customer engagement is a major change. The stakeholders need to make a set of difficult decisions about the future of customer engagement.

The simple choice between a common shared repository and product line specific information repository will require several trade-offs. For example, maintaining a common shared enterprise CRM with customer information, will require technical data integration from direct engagement, the shared product platform, and a set of third-party platforms. On the other hand, product line specific customer engagement requires duplication and increases the number of points of information security risk. You will develop a candidate architecture for the company that forces central decisions about customer engagement.

This assessment of the target will help your stakeholders understand the target, the opportunity, and threats to customer engagement success, as well as personal information security. This will allow you to identify a set of capability gaps that are candidates for the enterprise, and a set of patterns for the different products and projects to follow.

5 STAKEHOLDER MANAGEMENT

SITUATION 3-1

For situation 3-1 and 3-2, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM.

The EA team knows that the digital transformation initiative will change how the business works. They are now looking at how this will affect the IT portfolio roadmaps. One area they have found that needs to be changed is the enterprise CRM, which is currently set up for physical products. They need to make updates so that it can also handle digital products and services.

The EA team has been discussing various ways to approach things. You reported that after talking with your new colleague, some very helpful advice on digital transformation can be found in the TOGAF Library[1]. This advice includes the white paper titled “Seven Levers of digital Transformation”, which explains discuss the impact on digital transformation on Business Process (Lever 1), Customer Engagement and Experience (Lever 2), and Product or Service Digitization (Lever 3). You also believe the Digital Business Reference Model (DBRM) could be important as it addresses the key areas of Digital, Strategy, Structure, and Operations.

[1]<https://www.opengroup.org/library>

PROBLEM

You have been asked how you will ensure you have the correct stakeholders involved and have their support?

Which approach do you recommend and why?

Hint It is recommended to start by completing a stakeholder map using the information provided in the scenario.

5 STAKEHOLDER MANAGEMENT

Curriculum Reference:
LO -2.1 G186 §3.3.1, B

SITUATION 3-1

Approaches

1

You recommend adding stakeholders with expertise in consumer engagement and consumer experience for digital products and subscription services. This can be done by collaborating with subject matter experts (SMEs). You will add these SMEs as digital product stakeholders to the enterprise CRM roadmap.

You will look for changes to motivation, priority, and special requirements that the digital transformation creates for all stakeholders. As a result, you will then need to update the viewpoint library.

You will iterate a few times to identify the key concerns that will constrain the roadmap. You also expect that you will need to change how you represent the architecture to explain it better.

2

You recommend looking to the digital transformation initiative to provide strategic goals from top-level stakeholders. You have a list of stakeholders for the roadmap for the enterprise CRM and will use it to identify changes to motivation, priority, and requirements that are due to the digital transformation.

You will engage with subject matter experts (SMEs) who have expertise on consumer engagement and consumer experience for digital products and digital services. You will iterate a few times to identify the key stakeholders and key concerns that will constrain the future enterprise CRM roadmap.

You will then need to update the viewpoint library. You will adjust how you present the architecture to better communicate its purpose.

5 STAKEHOLDER MANAGEMENT

Curriculum Reference:
LO - 2.1 G186 §3.3.1, B

SITUATION 3-1

Approaches

3

You recommend using the existing enterprise CRM stakeholders as the stakeholders for the digital products and services as they represent all the product lines. You will identify the special concerns associated with digital products.

You will engage a digital product subject matter expert (SME) to tell you which roles are necessary for an optimal digital consumer engagement. You will use the roles identified to update the existing list of CRM roadmap stakeholders.

Using the list, you will identify the changes required to the enterprise CRM roadmap viewpoint library. The biggest task ahead will be to update how the architecture is represented to communicate it better in digital terms.

4

You recommend hiring a digital product subject matter expert (SME) to provide guidance on capabilities and stakeholders. With this guidance and the Digital Business Reference Model, you will assess the existing enterprise CRM capability model for potential impacts and gaps.

You will align required new business capabilities with the existing stakeholders or the ones identified by the SME. Based on those changes you will update the enterprise CRM Roadmap viewpoint library.

You will iterate a few times identifying the key concerns that constrain the future CRM roadmap. You will review how you represent the architecture to ensure effective communication.

40%
COMPLETED

SITUATION 3-2

For situation 3-1 and 3-2, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM.

The EA team is now working on the digital transformation initiative. They have developed an architecture to support the strategy for the initiative, with a roadmap to support the strategy, and have started working on architecting product development processes and customer experience.

As the CRM expert, you are developing an architecture that will support a completely different customer experience and engagement model. For instance, the current process for returning items only allows a refund or replacement after a product is returned and inspected; it doesn't work for digital products or services.

You have identified the following stakeholders and concerns (drawn from the TOGAF Series Guide: *A Practitioners' Approach to Developing Enterprise Architecture Following the TOGAF® ADM*, Appendices B & C):

- The traditional physical goods customers are mainly interested by the value proposition.
- The value proposition is also relevant to the digital download customers, as is the security of their transactions.
- The traditional high-touch bricks & mortar retailer are worried about the efficiency of the new system, the impact of the change on their operations and need to be reassured that the business will not be interrupted.
- The call-center operations leaders need to be sure that efficiency and business continuity will be improved. The change impact should be minimal, and they need a good value proposition.

You are going to find out what areas need improvement in customer engagement, from the perspective of each stakeholder, then identify changes that will address these areas. You will then find and report any changes that could cause problems or make things harder for other stakeholders. For every change that creates a problem you will analyze the value delivery, work, and uncertainty to achieve the value.

PROBLEM

You have been asked how you will ensure you have the correct stakeholders involved and have their support?

Which approach do you recommend and why?

[Note: The EA team has adopted the role definitions in the TOGAF Series Guide: *A Practitioners' Approach to Developing Enterprise Architecture Following the TOGAF® ADM*, Section 15.2]

5 STAKEHOLDER MANAGEMENT

Curriculum Reference:
LO -2.4 ADMT §10.2 G186 §6.1.2,
6.2

SITUATION 3-2

Approaches

1

You will promote understanding of value, work to realize, and risk of failing. You will let the consumer product owners decide when there is a trade-off to make between the customers preferences and the business partners preferences. Conflict between stakeholders can be resolved in two different ways. One way is to use the superior architecture[1] that provides a priority to a stakeholder or concern. The other way is to change one or more preferences until stakeholders agree.

2

You will make choices based on your understanding of the superior architecture. You will use reference material from the TOGAF Library to provide guidance on topics that are critical for success, for example Customer Experience and Engagement. There will be no conflict between stakeholders as you will put their concerns in order of the following priority: the customer will be first, business requirements owners second, and business partners last.

3

You will facilitate between the different stakeholders to better understand their value preference and priority, and the scope of change. You will resolve conflict between stakeholders in two different ways. One way is to use the superior architecture that provides a priority to a stakeholder or concern. The other way is to change one or more preferences until stakeholders agree. Changes to preferences for a stakeholder will be discussed and agreed with the stakeholder or the stakeholder agent.

4

You will push to resolve each conflict and produce an answer. You use the existing Stakeholder Map from the enterprise CRM architecture to create a Stakeholder/Concern matrix. You will use the existing enterprise CRM architecture to define constraining decisions and set priorities to handle conflicts between stakeholder preferences. The importance of the stakeholder in the Stakeholder Map will determine how conflict between stakeholder preferences is resolved.

[1] For an explanation of a superior architecture, see the TOGAF® Series Guide: A Practitioners' Approach to Developing Enterprise Architecture Following the TOGAF® ADM, section §5.3

6 PHASE A, THE STARTING POINT

SITUATION 4-1

For situation 4-1 and 4-2, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM.

In your area of responsibility, the enterprise CRM, you realize the need to create a new target architecture. The old ways of focusing on efficiency and expanding warranty services do not really help with the digital transformation.

Fundamental changes in customer engagement are also needed to support the digital transformation.

Some consumer product managers (responsible for both physical and digital products) are worried that customers aren't using the new digital products as much as they should be.

They want to figure out ways to make people more interested in these products.

They also think that in the future, physical and digital products will be sold and supported in similar ways.

PROBLEM

You have been asked by the EA team leader how you plan to set-up the architecture development project for the new target architecture addressing the concerns raised?

Which approach do you recommend and why?

6 PHASE A, THE STARTING POINT

SITUATION 4-1 Approaches

Curriculum Reference:
LO - 3.2 ADM §3.3 G186 §5.2.1

1

You will explain to the consumer product managers the different options to add digital products to the existing enterprise CRM. You will confirm a project timeline that fits with the CRM roadmap and budget cycle. You will involve the same stakeholders as identified on the Stakeholder Map created for the existing enterprise CRM roadmap. You know you will need to also involve digital product subject matter experts to complete the requirements for direct-to-consumer digital product and third-party interfaces to the enterprise CRM.

2

You will explain to the consumer product managers that this is a company-wide initiative covering both digital products and physical products. You will align the enterprise CRM roadmap timeline with the budget cycle. You will confirm that the key stakeholders are the consumer product owners, operational executives, someone representing corporate systems, and IT. You will look for guidance and assistance from a subject matter expert because digital products, and customer experience are outside your normal work area.

3

You will help the consumer product managers understand the options to create a company-wide product-centric solution. This will be a solution covering both physical and digital products. You will define which solution option to create before starting. You create a Stakeholder Map including the key stakeholders who are the consumer product owners. You recognize that you need external help for the project. You will hire digital product subject matter experts to write the requirements for direct-to-consumer digital product and third-party platform customer engagement.

4

You will confirm the project scope, decide if it is digital products only or company-wide, and what the planning horizon is. You need to know where the project will fit in the business cycle, for example if it will match up with the budget cycle of the enterprise CRM. You will identify who all the key stakeholders are and their issues. As this is outside your experience which is on IT-centric work, you will get help with digital products and customer engagement.

6 PHASE A, THE STARTING POINT

SITUATION 4-1

Curriculum Reference:
LO -3.2 ADM §3.3 G186 §5.2.1

NOTES

6 PHASE A, THE STARTING POINT

SITUATION 4-1

RECOMMENDED APPROACH GRID

Curriculum Reference:
LO - 3.2 ADM §3.3 G186 §5.2.1

My recommended approaches in order are....

Approach	Approach Number	Rationale

Third-Best		
 Incorrect		

6 PHASE A, THE STARTING POINT

SITUATION 4-2

For situation 4-1 and 4-2, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM.

During a meeting with the consumer product managers, some concerns were brought up.

These included how quickly products are released, innovation, efficiency, and the risks of using integrated and product-centric systems.

It seems like there are different opinions amongst the consumer product managers on what is needed and the best way to make progress.

PROBLEM

You have been asked how an architected approach will help resolve conflict, and lead to an improvement in customer engagement and relationship management?

Which approach do you recommend and why?

Hint Using the Business Scenario technique and Solution concept diagram may be helpful

6 PHASE A, THE STARTING POINT

SITUATION 4-2 Approaches

Curriculum Reference:
LO -3.1 ADM §3.2 G186 §5.2.1

1

You explain that an architected approach can be based on the existing enterprise CRM architecture because it is the current baseline. The existing enterprise CRM roadmap covers competing product line demands and the capacity of enterprise resources. You will extend the existing architecture approach to add the digital products to the enterprise CRM roadmap. This will meet the needs of products now and in the future.

2

You explain that an architected approach starts by making sure the problem is clearly defined. Once the problem is defined, you will identify stakeholders with concerns that are fundamental to the problem. You will also identify decisions that have already been made. You will develop an Architecture Vision that answers the problem and addresses the stakeholder concerns. You will then obtain the agreement of the stakeholders to proceed.

3

You explain that an architected approach starts after the problem is clear enough to define solutions and actions. You will identify the key stakeholders with interests in the problem and their concerns. You then develop and propose a summary solution to the problem. You ensure the stakeholders understand what the next steps will be and when changes will take place

4

You explain that an architected approach should be based on the knowledge and experience of the consumer product managers who have the most interest in the customer engagement. You will use the same approach that is used to build the enterprise CRM roadmap. This method helps achieve a balance between the needs and goals of the company's resources and the products they make. You will ensure that decisions are made based on value, and the resource necessary to deliver the value.

7 CASE STUDY PART 2

The additional information below applies to subsequent scenarios and situations unless stated otherwise.

Several months have passed and the company has continued to progress the digital transformation initiative using the three approaches (as described in the Case Study Part 1):

- The experiment of three product lines selling digital products directly to consumers under a different brand name has shown good results.
- The platform to support digital products based on a common approach to customer information integration and security works nicely.
- The two product lines selling digital products directly to consumers using third-party platforms has had good results too.

The three different approaches have proven to be successful and the company is now delivering digital products in multiple product lines.

The following business systems support the three approaches:

A call-center CRM system focused on warranty work for physical products. For the traditional physical products, specialist retailers manage the sales cycle, and the company only directly engages with customers for warranty.

A contact-center driven CRM system that provides direct customer engagement for sales and support using a third-party digital product platform. The platform has limited support for marketing, promotions, and sales.

An AI-bot, chat & email-based contact-center driven CRM system that provides direct customer relations for sales and support. This solution easily expands to support global marketing, promotion, and sales. It has rich data analytics.

An online chat/email-based contact center supported by a solution that is integrated with a digital platform that supports direct relations for sales and support of digital products.

This solution was quickly put together using a mix of apps and online tools. It doesn't have a lot of features for analyzing data or helping with marketing, promotions, and sales.

The company is making more changes for the digital transformation initiative and will now offer digital products or services with all their physical products.

7 CASE STUDY PART 2

NOTES

8 ARCHITECTURE DEVELOPMENT

Please note that Case Study Part 2 applies to the following situations.

YOU HAVE A NEW ROLE

For situation 5-1 and 5-2, your role is a senior architect working within the Enterprise Architecture (EA) team, and your area of responsibility is the enterprise CRM, and includes approaches for co-existence with the systems produced as part of the digital transformation initiative.

SITUATION 5-1

You are working on a major update to the roadmap for the enterprise CRM.

In this update the roadmap will be extended to include the digital products and embrace the three approaches from the digital transformation initiative.

A meeting was held with three groups of important stakeholders to understand their motivations:

- the digital product owners, who are motivated by digital product time-to-market
- the business-unit operational leaders, who are motivated by customer experience
- corporate IT, who are motivated by reducing technology maintenance costs

PROBLEM

The EA team leader wants to know your approach for creating a target business architecture that addresses the integration of the three approaches supporting digital products, and that meets the needs of the key stakeholders.

Which approach will you choose and why?

8 ARCHITECTURE DEVELOPMENT

Curriculum Reference:
LO - 4.3 ADM §4.2 G186 §5.2.2
LO - 4.4 ADM §4.3 G186 5.2.2
LO - 4.5b

SITUATION 5-1 Approaches

1

You will create a model of the current state including: business capabilities, value streams, the organization map, and the information map. You will then adapt that model to enable faster time to market, improve customer experience, and reduce maintenance costs.

You will then create views that describe the business capabilities, value streams, organization map and information map in the context of time to market, customer experience, and cost. Finally, you will identify the gaps between the current and target and will create roadmap components for the changes needed.

2

You will model the business capabilities, value streams, organization map and information map. Using these models you will determine where the business does not support product time-to-market, is not providing a good customer experience, and where it drives maintenance costs up.

You will also use the models to identify changes needed within the business to address the motivations of the key stakeholders. You will:

- identify changes to improve the value stream
- develop the business capabilities
- change the organization
- improve information flow in terms of time-to-market, customer experience, and cost.

Finally, you will find out the stakeholders priorities for enhancing business capability, value stream and information flow.

8 ARCHITECTURE DEVELOPMENT

Curriculum Reference:
LO - 4.3 ADM §4.2 G186 §5.2.2
LO - 4.4 ADM §4.3 G186 5.2.2
LO - 4.5b

SITUATION 5-1

Approaches

3

You will model the business capabilities, value streams, organization map, and information map. You will apply the modeling techniques described in the TOGAF Series Guides related to Business Architecture.

You will use these models to put together an integrated Business Architecture. The gaps between the current state and the target architecture will show where change is needed and where new functionality needs to be implemented.

Finally, you will create architecture views to describe the target state from the three points of view: time-to-market, customer experience, and maintenance costs.

4

You will determine which areas of the business do not support product time-to-market, customer experience, and are driving costs up. This could be, for example in areas such as organizational design, processes, and business location.

You will identify what changes are needed to enable faster time to market, improve customer experience, and reduce maintenance costs. You will also determine what changes are needed to achieve different benefits in terms of time-to-market, customer experience, and cost.

Finally, you will determine if the stakeholders think the different changes are worth the effort to make the change.

8 ARCHITECTURE DEVELOPMENT

PROGRESS TRACKER

8 ARCHITECTURE DEVELOPMENT

SITUATION 5-2

For situation 5-1 and 5-2, your role is a senior architect working within the Enterprise Architecture (EA) team, and your area of responsibility is the enterprise CRM, and includes approaches for co-existence with the systems produced as part of the digital transformation initiative.

You are continuing to work on the major update to the roadmap for the enterprise CRM; the scope is to be extended to include digital products and the three supporting approaches. A review held previously identifies the core motivations for the key stakeholder communities as digital product time-to-market, customer experience, and driving down technology maintenance costs.

A review of the Business Architecture involving the key stakeholders has been completed. This review identified where poor customer experience is coming from the current third-party platform value streams and information flows. Changes to the information flows will improve customer experience. This will require changes in activity inside both value streams. All the stakeholders agree that the customer experience can be improved. The value streams use a lot of IT resources and that is expensive.

PROBLEM

The EA team leader asks what do you need to know to address the motivation to improve the customer experience while reducing the technology maintenance costs?

Which approach will you choose and why?

8 ARCHITECTURE DEVELOPMENT

SITUATION 5-2

Approaches

Curriculum Reference:
LO - 4.3 ADM §4.2 G186 §5.2.2
LO - 4.5 ADM §6.2, 7.2 G186 §5.2.2
LO - 4.6 ADM §6.5, 7.5 G186 §5.2.2
LO - 4.9 ADM §4.4, 6.4, 7.4 G186 §5.2.2

1

You will focus on the information system service and logical application component. You will identify where the application architecture does not support efficient product time-to-market, optimal customer experience, and creates high maintenance costs.

You will determine the necessary changes to the information flows, specifically in the data entity and logical data component, to achieve a faster time to market, improved customer experience, and reduced maintenance costs.

Finally, you will find out the stakeholders' priorities for the improved business capability, value stream, and information flow.

2

You will create application and data models of the current state for the direct-to-customer system, the digital product platform, and the third-party product platforms. You will develop a target architecture model showing how to enable faster time to market and reduce maintenance costs.

You will then create views that describe the changes to the direct-to-customer system and the digital product platform. The views will show the workarounds or changes to the third-party product platforms to improve the time to market and reduce maintenance costs.

Finally, you will identify the gaps between the current and target to create roadmap components for the changes.

8 ARCHITECTURE DEVELOPMENT

SITUATION 5-2

Approaches

Curriculum Reference:
LO -4.3 ADM §4.2 G186 §5.2.2
LO -4.5 ADM §6.2, 7.2 G186 §5.2.2
LO -4.6 ADM §6.5, 7.5 G186 §5.2.2
LO -4.9 ADM §4.4, 6.4, 7.4 G186 §5.2.2

3

You will analyze the application and data architecture of the direct-to-customer, and third-party platform systems to identify where they are causing the information flow problem. You will identify the changes that are needed to the direct-to-customer system to fix the information flow.

You will identify what changes, or work arounds, can be made to the third-party platform to address the information flow. You will look for incremental changes that deliver an improvement to customer experience. You will identify what work is needed to reduce maintenance costs and what the impact will be.

Finally, you will check with the stakeholders if they think the improvements in customer experience are worth the work and ongoing maintenance cost.

4

You will identify where the application architecture and data architecture are causing delays in product time-to-market, making the customer experience worse, and leading to high maintenance costs.

You will focus on the logical application components and logical data components.

You will identify what changes to those components will enable faster time to market, improve customer experience, and reduce maintenance costs. You will determine what work is needed to improve the direct-to-customer platform and what improvements to the third-party product platforms are needed in terms of time-to-market, customer experience, and cost.

Finally, you will ask the stakeholders what their priorities are on the application development, data structures, and interfaces that improve time-to-market, customer experience, and reduce maintenance cost.

PROGRESS TRACKER

8 ARCHITECTURE DEVELOPMENT

YOU HAVE A NEW ROLE

You are a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the in-house digital product platform at the "Architecture to support Portfolio" level. Others on the EA team support the enterprise IT portfolio and customer engagement.

SITUATION 5-3

You are in regular contact with the digital product owners, their development teams, and the CIO. Before this project, you developed a reference model for business capabilities, value streams, information mapping, a logical application model, including a supporting data architecture, all based on the third-party platforms.

You are working on the digital product roadmap. You have three key stakeholder groups – the digital product owners, the business-unit operational leaders, and corporate IT. You know that the stakeholders are comfortable building experimental digital products on the third-party platforms. However, everyone wants to keep the in-house digital platform. A major constraint is to follow regulations from all around the world and keep customers' personal information safe. Customer personal information must be kept in their region of the globe.

The EA team leader has talked to the key stakeholders. They all agree that customer experience must be validated and shown to be an improvement before creating any new digital products. The current approach involves a lot of technology resources which makes it really costly to run. This is something that needs to be fixed.

PROBLEM

The EA team leader asks what do you need to know to address the need to reduce the technology costs?

Which approach will you choose and why?

8 ARCHITECTURE DEVELOPMENT

SITUATION 5-3

Approaches

Curriculum Reference:

LO - 4.3 ADM §4.2 G186 §5.2.2

LO - 4.7 ADM §8.2, G186 5.2.2

LO - 4.8 ADM §8.5, G186 §5.2.2

LO - 4.9 ADM §8.4 G186 §5.2.2

1

You will find out where the application architecture interacts with customer data. You will confirm if the applications of the in-house digital platform, after some changes, can address the data regulation and residency concerns, or if the third-party platforms can fulfill these requirements.

You will determine if some changes are necessary for other reasons, and if there are any changes that can deliver an improvement to customer experience. You will determine the impact of the potential changes in application architecture on the technology architecture (infrastructure). You will identify the costs for the infrastructure and applications in the distributed data systems. You will calculate the work required and the impact on ongoing technology costs.

Finally, you will check if the stakeholders think the various changes are worth the effort.

2

You will model the current state of the direct-to-customer system, the in-house digital product platform, and the third-party product platforms. You will then develop a revised model of a target state that will include faster time to market, improve customer experience, and reduce technology costs.

You will then create views that describe the changes to the direct-to-customer system and the in-house digital product platform. The views will show the workarounds or changes to the third-party product platforms to improve the time to market and reduce technology costs.

Finally, you will identify and document the gaps between the current and target to create roadmap components for the changes.

8 ARCHITECTURE DEVELOPMENT

SITUATION 5-3

Approaches

Curriculum Reference:

LO - 4.3 ADM §4.2 G186 §5.2.2

LO - 4.7 ADM §8.2, G186 5.2.2

LO - 4.8 ADM §8.5, G186 §5.2.2

LO - 4.9 ADM §8.4 G186 §5.2.2

3

You will determine where the application architecture (information system service & logical application component) does not support product time-to-market, and customer experience.

You will identify changes to the information flows (data entity, logical data component) necessary to meet the data regulation and residency requirements. You will define what needs to change in the technology architecture to enable the changes to the information flows.

You will identify changes that impact the infrastructure technology costs. You will ask the stakeholders for their priorities on the enhanced business capability, value stream, and information flow

4

You will identify where the application architecture and data architecture (logical application components and logical data components) do not support product time-to-market, customer experience, and increase costs.

You will identify changes to the information flows (data entity, logical data component) to make possible faster time to market, improve customer experience, and reduce maintenance cost. You will find out what the priorities of the stakeholders are for the application development, data structures, and interfaces that improve time-to-market, customer experience, and cost.

Finally, you will determine the costs to make the necessary changes in the application and data architecture. These costs may be at the applications, the product platform, or the integration to the product platform.

8 ARCHITECTURE DEVELOPMENT

SITUATION 5-3

9 IMPLEMENTING THE ARCHITECTURE

YOU HAVE A NEW ROLE

For situations 6-1 to 6-3, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM, which now also includes planning for support for digital products.

SITUATION 6-1

You are progressing on the big update to the roadmap for the enterprise CRM to include support for digital products; the target business architecture has been defined with a focus on enhancing the customer experience and reducing technology costs. Some people on your team are looking at different aspects of the business, like customer engagement models, technical features, and possible limitations of different solutions. The IT stakeholders are worried that the experimental changes that the team tries out might become permanent. The stakeholders in charge of digital products are also concerned because they are being asked a lot of questions about the future, when they are just trying to focus on developing a capability to offer digital products and figuring out how different methods will have an impact.

As you work on the development, you look at the architecture that was developed for the digital transformation initiative (the superior architecture). You start using the architecture development work to create unified matrices that show the key components, their applicability to the different customer engagement models, and the gap between current state and a candidate target state.

PROBLEM

You are progressing in your work on the major update to the roadmap for the enterprise CRM to support digital products. The EA team leader asks what you will work on next? . Which approach will you choose and why?

Note: “key components” represent the appropriate items in an enterprise metamodel. It is also possible to use business capability, logical software, logical data, logical technology, etc. to maintain consistency during the analysis.

Note: The term “superior architecture” refers to the architecture created for larger scope and purpose. For example, for Architecture to Support Portfolio, the Architecture to Support Strategy is the superior architecture. In this exercise a superior architecture has been developed in Unit 2 Situation 2. See the TOGAF Series Guide: *A Practitioners’ Approach to Developing Enterprise Architecture Following the TOGAF® ADM*, §3.2.1, §5.3]

Hint You may wish to consider creation of Phase E architecture deliverables to help identify the best approach, for example:

- Benefits Diagram,
- Consolidated Gaps, Solutions and Dependencies Matrix,
- Implementation Factor Catalog

9 IMPLEMENTING THE ARCHITECTURE

SITUATION 6-1

Approaches

Curriculum Reference:
LO -5.3 ADM §9.3.8
LO -5.4 ADM §9.3
LO -5.5 ADM §9.3
LO -5.7 ADM §10.3.2 G186 §3.4, 9.2.2

1

You will create views to show the stakeholders how a fully integrated enterprise CRM can be used and its benefits. This will help address the concerns of the IT stakeholders who are worried that the experiments will become a permanent solution.

You identify gaps in the superior[1] architecture that need to be resolved to implement a fully integrated enterprise CRM. You quantify the business value and work needed to produce a series of value improvements. You define work packages, group them, and assign them to gaps.

Finally, you consolidate the work packages into transition states that will best lead to a fully integrated CRM system.

2

You will create views that address the IT stakeholders' concern, and digital products stakeholders' objectives. You use the views to create a timeline that shows when specific gaps need to be resolved for the stakeholders.

You identify other gaps in the superior architecture that must be resolved. You quantify the business value and work needed to realize a stepwise improvement of value. You then group the gaps and work packages. With the help of the stakeholders, you then classify the work packages in three categories: the ones that support a revolutionary, evolutionary, or greenfield approach.

Finally, you consolidate the work packages into transition states that deliver sufficient value to justify the effort.

[1] For an explanation of a superior architecture, see the TOGAF® Series Guide: A Practitioners' Approach to Developing Enterprise Architecture Following the TOGAF® ADM, section §5.3

LO - 5.4 ADM §9.3

LO-5.5 ADM §9.3

LO - 5.7 ADM §10.3.2 G186 §3.4, 9.2.2

3

You will create views to show the stakeholders the benefits of supporting multiple different options for product development. You identify objectives in the superior architecture for the digital transformation initiative that support an experimental approach. You link those objectives to the existing engagement models. You quantify the business value and work that will be needed to realize value improvements. You then group the gaps and work packages to resolve the gaps with an evolutionary approach to minimize rework.

Finally, you consolidate the work packages into transition states that best support efficient digital product development.

4

You will create views that show your team's concerns to help them fully understand the objectives and value of different capabilities and features. You identify gaps in the superior architecture that must be resolved no matter what the current stakeholder's concerns are.

You quantify the business value and work needed to realize stepwise improvement of value. You then group the gaps and work packages. You classify the work packages in three categories: the ones that support a revolutionary, evolutionary, or greenfield approach.

Finally, you assign the work packages to transition states that will deliver sufficient value to make the work worth the effort.

9 IMPLEMENTING THE ARCHITECTURE

SITUATION 6-2

For situations 6-1 to 6-3, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM, which now also includes planning for support for digital products.

You finished updating the roadmap for the enterprise CRM; it now includes planning to support digital products. As part of the first transition architecture, you got approval to keep the current enterprise CRM, while the business systems supporting the three approaches in the digital transformation initiative will have their own CRM systems.

Important parts of your planning are rules for getting rid of the temporary systems in a later stage of the transition, standards for keeping information secure, and protecting the global brand. You have drafted multiple Architecture Requirements Specifications, including conformance tests.

There are several implementation teams involved:

- The in-house digital platform team
- Three direct-to-customer product teams
- Two teams using third-party platforms

PROBLEM

The EA team leader has received a request for the team to engage with the implementation teams.

[Note: This request extends the team to work at the Architecture to Support Project purpose.]

Which approach will you choose and why?

9 IMPLEMENTING THE ARCHITECTURE

SITUATION 6-2

Approaches

Curriculum Reference:
LO -5.12 ADM §11.3.8 G186 §11.4, 15.1.2
LO -5.13 ADM §11.4 G186 §5.2.2
LO-5.14 EACG §5.2 G186 §3.3.2

1

You will work with the implementation teams to make sure that they understand the applicable Architecture Requirements Specification. You explain to each team that by using the specification they can determine the gaps the implementation must address, and also the controls.

You check the planning horizon of the transition architecture to see the date by which the systems must implement the architecture. You will follow-up with each of the development teams regularly based on the schedule. You will report on status as needed following the governance process.

2

You will work with the implementation teams to define their responsibilities. This will include creating Architecture Contracts, that cover the architecture specifications and conformance tests. This will ensure each of the implementation teams know what is expected and how the implementation will be assessed.

You will come to an agreement with the development teams, and your stakeholders, about when the new architecture will be implemented. You will hold follow-up meetings with the development teams to check on their progress at important points in the implementation plan. You will use the development timeline to plan when to report in accordance with the governance process.

SITUATION 6-2

Approaches

Curriculum Reference:

LO - 5.12 ADM §11.3.8 G186 §11.4, 15.1.2

LO - 5.13 ADM §11.4 G186 §5.2.2

LO - 5.14 EACG §5.2 G186 §3.3.2

3

You will publish the architectures including the Architecture Requirements Specifications for each project in your repository. This will allow the implementation teams to access a copy. You will regularly follow-up with the implementation teams to assess their progress and ensure they implement the architecture.

You will ensure that the implementations comply with the implementation guidelines, implementation specifications, and the interoperability requirements, that are defined in the Architecture Requirements Specifications.

4

You will work with each of the implementation teams to create an Architecture Contract. This contract will outline the architecture specifications, requirements and controls that the implementation needs to meet. You will make sure these specifications are clear, specific, and exclusionary to allow for creativity during implementation. This helps to ensure that they align well with the teams' development plans.

You will also agree with the development teams and your stakeholders on the timeline for when this new architecture will be put into place. You will need to be available for meetings with these teams to help them understand the architecture and make any necessary adjustments to their testing process to align with the architecture.

Lastly, you will help with the reporting process through the existing governance process

PROGRESS TRACKER

9 IMPLEMENTING THE ARCHITECTURE

SITUATION 6-3

For situations 6-1 to 6-3, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM, which now also includes planning for support for digital products.

The EA team leader calls you into a meeting with all the physical and digital product managers. It turns out that one of the third-party platforms, that includes an AI-bot, has important limitations regarding consumer information protection and residence.

This is a serious issue since the AI-bot has been incredibly successful, with sales of the digital product growing 30% month-over-month.

To protect the brand, the use of the third-party platform will be stopped. Everyone hopes a way can be found to continue selling the digital product. Or Everyone hopes the digital business product can be saved; with what application that is done is not important, the business revenue must be protected.

PROBLEM

The EA team leader lets you know that the product team is completely available and asks you to provide the key stakeholders with a summary of an alternative approach that will allow the digital product to continue to be sold and protect the business revenue.

Which approach will you choose and why?

9 IMPLEMENTING THE ARCHITECTURE

SITUATION 6-3

Approaches

Curriculum Reference:
LO - 5.3 ADM §9.3.8
LO - 5.6 ADM §10.3 G186 §5.2.2, 9, 10.4, 10.6
LO - 5.15 G186 §8.3

1

An approach can be summarized as follows:

The system choices to be considered are:

1. A revolutionary change on the product to accommodate the in-house platform
2. A revolutionary change on the product on the other third-party platform

The current work plans and capacity of the in-house platform team will be important considerations. It is a great opportunity to extend the in-house platform, but you believe the risk is too high because the product team is used to working with commercial providers and the in-house platform does not fully support digital products, customer engagement, and is not well documented. You will document the option for the third-party platform.

2

An approach can be summarized as follows:

The system choices are:

1. A greenfield approach using a completely new platform
2. Undertake a revolutionary change on the in-house platform to accommodate the product
3. A revolutionary change on the product to accommodate either of the two available platforms

You explain that an evolutionary approach is not appropriate to the situation, and so you have identified these three options.

An important consideration will be the current work plans and how much the in-house platform team can handle. Each of the choices has very different impacts and risks. You will document the opportunity, risk, and work for each.

9 IMPLEMENTING THE ARCHITECTURE

SITUATION 6-3

Approaches

Curriculum Reference:

LO -5.3 ADM §9.3.8

LO -5.6 ADM §10.3 G186 §5.2.2, 9, 10.4,
10.6

LO-5.15 G186 §8.3

3

An approach can be summarized as follows:
The system choices to be considered are:

- A greenfield approach using completely new platform
- Undertake a revolutionary change on the in-house platform to accommodate the product
- A revolutionary change on the product to accommodate either of the two available platforms

Firstly, you will refer to the approved transition architecture for guidance. This defines an approach for change including removing the temporary systems, making sure information is secure, and brand protection. Each choice has different impacts and risks.

You will visually document the opportunity, impacts, risk, and work involved in each choice. A key consideration is whether the in-house platform team has the time and ability to handle the changes.

4

An approach can be summarized as follows:

The system choices to be considered are:

1. A revolutionary change on the product to accommodate the in-house platform
2. A revolutionary change on the product on the third-party platform

The product team understands they will need to take a revolutionary approach to adapt their product to fit into one of the platforms. Enhancing and extending the in-house platform, improving it with both data analytics and AI-bot technology would be a recommended step. These new features will be very beneficial elsewhere.

PROGRESS TRACKER

10 ARCHITECTURE CHANGE MANAGEMENT

SITUATION 7-1

For situations 7-1 and 7-2, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM.

The projects on the roadmap to make the enterprise CRM more efficient have been approved. One of the projects to expand the system to a new country, to help with warranty needs there, is almost finished.

You've been really busy creating the roadmap and making sure the expansion goes smoothly.

One of the efficiency improvement projects to come will be very complex; it includes important process and system changes to enable chat and email contact with the customer service agents.

PROBLEM

You have a meeting with the EA team leader to discuss status of your work. The EA team leader asks you what you see as the next steps for the enterprise CRM and how you see your role in that process.

Which approach will you choose and why?

10 ARCHITECTURE CHANGE MANAGEMENT

Curriculum Reference:
LO -6.1 ADM §12.2 G186 §14

SITUATION 7-1

Approaches

1

You explain that you are going to have another busy year. Adding chat and email to the global system is going to have major process, staffing, and system implications. You expect to be very busy with implementation governance. These new capabilities will help extend the architecture for the enterprise CRM to directly support digital products.

2

If you follow the same approach as last year, you will be busy helping with major process, staffing, and system changes. You will not have time to think about the future architecture of the enterprise CRM. You explain that you need to ask guidance from the stakeholders to define their preferences, priorities, and how to measure value. Adding chat and email to the enterprise CRM is going to have major process, staffing, and system implications.

3

You explain that you will have to dedicate your time to implementation governance for the main project addressing efficiency improvement. Adding chat and email to the enterprise CRM is going to have major process, staffing, and system implications. Based on your experience from the previous system extension and roadmap development, you anticipate beginning the annual roadmap update earlier this year.

4

You explain that you will have another busy year. Introducing chat and email to the global system will require a lot of resources, including time, people, and technology. You will need to focus on implementation governance. You will have a conversation with the stakeholders of the enterprise CRM about the new capabilities to see when to extend the architecture to directly support digital products.

10 ARCHITECTURE CHANGE MANAGEMENT

SITUATION 7-2

For situations 7-1 and 7-2, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM.

The projects on the roadmap to make the enterprise CRM more efficient have been approved. One of the projects to expand the system to a new country, to help with warranty needs there, is almost finished.

You've been really busy creating the roadmap and making sure the expansion goes smoothly.

One of the efficiency improvement projects to come will be very complex; it includes important process and system changes to enable chat and email contact with the customer service agents.

PROBLEM

You have a meeting with the EA team leader to discuss status of your work. During the meeting it is agreed that neither you, nor the EA team, can support how the experiments will be handled. The EA team leader asks what you are going to change to ensure that you and the team can meet the expectations

Which approach will you choose and why?

10 ARCHITECTURE CHANGE MANAGEMENT

SITUATION 7-2

Approaches

Curriculum Reference:
LO - 6.2 ADM §12.3 G186 §14
LO - 6.3 ADM § 12.4 G186 §5.2.2

1 You explain that you need support to document the gaps, work packages, Architecture Requirements Specification, and controls for the Portfolio. This means you will not have time to engage directly in the implementation project. In this experimental phase, the digital product changes and unplanned approaches are becoming a barrier for supporting digital products in the future. You need to focus on creating a target architecture for a combined digital/physical world. The stakeholders will need to provide the resources to manage change.

2 You explain that in this situation it is better if you stop your work on the roadmap for the enterprise CRM and focus on implementation governance for the major efficiency project. Adding chat and email to the enterprise CRM is going to have major process, staffing, and system implications. It will be important to define an Architecture Contract detailing the controls and architecture requirements used to test conformance to help deliver the solution. You will also help with the governance of the implementation and operational changes.

3 You explain that to improve sustainability, we cannot continue to grow technical debt. When the company followed a strategy to make experiments possible, the unplanned approach created coordination problems. Due to the complex situation, it is better to deal with the technical debt as soon as possible and resolve it at the architecture level. You must stay directly involved in the implementation governance of these projects. You will guide the addition of chat and email to the enterprise CRM so the architecture can better support digital products.

4 You explain that you are going to improve the documentation and increase the support available to the implementation team, especially for the Architecture Requirements Specification, and controls. The work to document these artifacts will be helpful later in the project because it gives a purpose and constraints to the implementation team. You will be free to focus on developing a target architecture for a combined digital/physical world, as soon as the implementation team have the Project and Solution Delivery artifacts.

11 REQUIREMENTS MANAGEMENT

SITUATION 8-1

For situation 8-1, your role is a senior architect working within the Enterprise Architecture (EA) team. Your area of responsibility is the enterprise CRM.

You started the annual update of the roadmap for the enterprise CRM. Your most important objectives are to improve overall efficiency and maintain the unique value proposition of each consumer product line.

During the update of the roadmap a decision was taken to move a successful digital product from running as an experiment to continued operation. This product requires customer support based on a CRM system that uses an AI-bot, chat and email-based CRM system. This enables sales and support to provide direct customer engagement for the digital product.

You understand this CRM system was quickly assembled out of third-party tools and workarounds. The system has serious customer information limitations and cannot be used globally.

PROBLEM

The status of a digital product is changing from experimental to operational. What will you do next?

Which approach will you choose and why?

11 REQUIREMENTS MANAGEMENT

SITUATION 8-1

Approaches

Curriculum Reference:
LO - 7.1 ADM §13.2 G186 §6.1.1, 6.1.2
LO - 7.3 ADM §13.4

1 You will assess the impact to extend the enterprise CRM with the capability of the experimental product. You will create a Requirements Impact Assessment to identify the changes that should be made and the implications. You will submit the results of the assessment to the Architecture Board.

2 Since the digital product's status has changed to become operational, you need to know if that affects your current work on the annual update to the roadmap. To determine this, you will consult with the Architecture Board. If it affects your work, you will adjust your current architecture project with the guidance from the Architecture Board.

3 You will keep developing your work plan to ensure you meet expectations for the enterprise CRM roadmap. You will begin a separate architecture project to address the CRM solution for the digital product.

4 You will discuss with your stakeholders about the impact of the change in status of the digital product from experiment to operational. This discussion will focus on how this change will affect the scope, stakeholders, and objectives for your work. Based on the assessment and directions from the stakeholders, adjustments will be made to your current architecture project
